

Here is information on
“Bat Rolling” from a
person who does it!

Each bat I roll is treated like my own. With new bats, I take all efforts to maintain overall appearance of your bat such as graphics & paint making sure they look them same as when you sent it in. I roll bats evenly both parallel & perpendicular, to ensure that almost entire barrel becomes on giant sweet spot. Bats are rolled in most cases same day recieved & shipped next business day via USPS Priority 2-3 day services. Photos will be taken of your bat during the process and emailed to you upon completion, just prior to return shipping.

What is bat rolling?

Bat rolling is a compressing process which expedites the break in period of a composite bat. I roll bats through my bat rolling machine which is specifically designed for bat rolling. The entire barrel will be **EVENLY** broken in and there will not be any dead spots in the bat.

Why do you need your bat rolled?

It reduces the amount of time to break in your bat. This is a **COMPLETE** break in of your bat, not only a certain part of the barrel, but the whole barrel and it's evenly broken in. Most composite bats get hotter as they get older. The more hits on a composite bat, the better performance you get out of it. A rolled bat is similar to having approximately **500 hits** on a composite bat. Rolling will eliminate dead spots, instantly giving a brand new bat around **30-60 feet more distance**, which can be the difference

between a homerun and an out. Your line drives and ground balls will get through the infield with blazing speed.. If you don't have a rolled bat, chances are your opponent will have one and will have the advantage on your team. A rolled bat will increase the pop in your bat and that will equal more distance. I have heard but not have been able to confirm that bat rolling prolongs the life of composite bats. Your line drives will get through the infield faster which will result in more hits. I have brought bats which friends have thought were dead back to life. Bat rolling is LEGIT, it is not an alteration or modification to the bat. You will not be able to tell your bat has been rolled except by its performance. Bat rolling will NOT void the manufacturer's warranty like shaving will. There is no end cap removal.

Rolling does not shorten the life of your bat

Once you bat has been rolled it will have the same durability it did before rolling. It will however be performing at its highest level.

Roll your bat even if it's already been used

Even bats the have been used will benefit from our rolling process. Bats that have 300-400 hits on them are being rolled all the time and after the owners get the bats back they are will be very surprised with the results. In most cases you haven't properly broken your bat in and after a good rolling your bat will performance at it's highest potential.

Types of bats that can be rolled

Any composite bat can be rolled to increase the performance. This includes Softball bats (Fastpitch or Slowpitch) and Baseball bats (2 1/4", 2 5/8" and 2 3/4' barrels). Some people claim to roll Aluminum bats but it is not worth it since it does not improve performance at all on an aluminum bat.
